

Topic:-

Make a presentation on pollution of Ganga and Yamuna Rivers and effects of air pollution on Tajmahal.

Introduction:-

Pollution of the Ganga and Yamuna Rivers:

The Ganga and Yamuna rivers are both sacred rivers in India and are considered lifelines for millions of people who live along their banks. Unfortunately, both rivers have been heavily polluted due to various reasons such as industrial and domestic waste being dumped into them, untreated sewage, and agricultural runoff.

According to a report by the CPCB in 2020, the water quality of the Ganga and Yamuna is severely deteriorated. The report stated that out of the 36 monitoring stations on the Ganga River, only one met the criteria for bathing, while the rest were either moderately polluted or heavily polluted. Out of the 27 monitoring stations on the Yamuna River, only one met the criteria for bathing, while the rest were either moderately polluted or heavily polluted.

The pollution of these rivers has led to the degradation of the riverbanks and the surrounding ecosystem. It has also impacted the health of people who depend on these rivers for drinking water and the aquatic life. Furthermore, it has also affected the tourism industry in the region, as people are hesitant to visit these polluted areas.

To tackle this issue, the Indian government has launched several initiatives such as the Namami Gange Programme and the Yamuna Action Plan. The Namami Gange Programme aims to clean and rejuvenate the Ganga River, नमामि गंग while the Yamuna Action Plan focuses on restoring the ecological health of the Yamuna River. These initiatives include various measures such as the construction of sewage treatment plants, setting up of monitoring stations, and strict regulations on industries to prevent them from polluting the rivers.

Effects of air pollution on the Taj Mahal:

The Taj Mahal is a mausoleum located in the city of Agra in northern India. It is made of white marble and is considered one of the greatest examples of Mughal architecture. However, over the years, the monument has been under threat due to the high levels of air pollution in the region.

The primary source of pollution is the large number of industries and vehicles in and around the city of Agra. The pollutants in the air have led to the yellowing of the Taj Mahal's white marble surface, which has caused irreversible damage to the monument. In addition the pollutants in the air can lead to respiratory illnesses in people who live in the area

To tackle this issue, the government has taken several measures such as banning the use of coal in industries and encouraging the use of cleaner fuels. The government has also set up a monitoring station near the Taj Mahal to keep track of the air quality in the area.

Furthermore, the government has also taken measures to limit the number of vehicles allowed near the Taj Mahal to reduce air pollution.

both pollution of the Ganga and Yamuna rivers and the effects of air pollution on the Taj Mahal are significant environmental issues in India.

It is essential that the government, industry, and people work together to address these issues and ensure the long-term sustainability of these natural and cultural resources. Several initiatives such as the Namami Gange Programme and the Yamuna Action Plan have been already started by government as mentioned earlier.

Advantages:-

1. Creates awareness about pollution.
2. Protects rivers and aquatic life.
3. Helps preserve the Taj Mahal.
4. Improves public health and environment.
5. Encourages cleanliness and pollution control.

Disadvantages:-

1. Pollution control is costly.

2. Industrial rules may increase expenses.
3. Public awareness takes time.
4. Waste dumping still continues.
5. Damage to the Taj Mahal may not be fully repaired.

Conclusion:-

Pollution in the Ganga and Yamuna Rivers and air pollution around the Taj Mahal are major environmental problems. Proper waste management, strict laws, and public awareness are important to protect rivers and historical monuments.
