

Topic:-

Collect the official data about present and a decade old population of various Asian countries and plot a graph of that data. With the help of it, draw your conclusions about demographic changes.

Introduction:-

The population of various Asian countries has been a subject of interest and concern for policymakers, researchers, and the general public alike. Understanding the population trends, such as changes in size and distribution, is crucial for informed decision-making in areas such as healthcare, education, housing, and employment. In this context, this topic examines the official data of the present and a decade-old population of several Asian countries and plots a graph of that data. By analyzing this data, we can gain insights into the changing population dynamics of different Asian countries and their implications for the future.

Here are the graph for populations of various Asian countries as of 2010 and the latest available data for 2021, sourced from the United Nations Population Division:

Here are data for more Asian countries in chart.

Country	Population in 2010	Population in 2021
China	1,341,335,000	1,443,632,000
India	1,210,193,422	1,393,409,038
Indonesia	239,870,937	276,361,783
Pakistan	173,593,384	225,200,000
Bangladesh	148,692,000	166,303,498
Japan	127,450,000	125,960,000
Philippines	94,013,200	111,046,913
Vietnam	87,375,000	98,156,652
Iran	74,196,400	85,262,080
Turkey	72,586,256	84,339,067

Advantages:-

1. Helps in understanding population growth trends in Asian countries.
2. Develops skills in collecting, organizing, and analyzing statistical data.
3. Improves graph-making and data interpretation abilities.
4. Provides knowledge about demographic changes over time.
5. Helps compare population growth rates among different countries.
6. Enhances awareness of social and economic challenges caused by population changes.

Disadvantages:-

1. Population data may vary slightly depending on the source.
2. Collecting accurate and updated data can be time-consuming.
3. Graphs may not show all factors affecting population change.
4. Errors in data collection or graph plotting can affect conclusions.
5. Population figures alone do not explain migration, birth rates, or death rates in detail.

Conclusion:-

The comparison of present and decade-old population data of various Asian countries shows significant demographic changes. Most countries have experienced population growth, while some have shown slower growth due to lower birth rates and aging populations. The graphical representation makes it easier to understand these trends and compare countries. This study highlights the importance of population analysis for future planning, resource management, economic development, and social welfare.
